## Introduction

The Department of Drinking Water Supply is undergoing a paradigm shift in its focus from mere coverage of habitations to universal access to rural people with sustained and safe drinking water supply. In this regard a national delegation comprising experts from various organizations joined to develop a statewise Strategy Paper for Andaman&Nicobar rural drinking water supply.

The objectives were defined as:

**Top 1-** To enquire about current practices of overall water management

**Top 2-** Identification of specific issues (problems) pertaining to rural drinking water supply

**Top 3-** Suggest methodologies for incorporating environmental friendly and sustainable solutions to be adopted by the state

**Top 4-** Potential and conflicts arising from IWRM principles

Based on the findings in the fields recommendations were given to further improve on the water supply system.

### ***Current centralized water supply scheme at Bartang island***

Based on the information of local engineers it is understood that Bartang runs a centralized water supply system using spring water as a primary source. These systems are designed in the following manner as shown in the flow diagram in Fig. 6-2:

**Figure 0-1: Conceptual flow diagram of the water supply scheme at Bartang (South Andaman).**

The technical set-up of this existing system found high appreciation among the experts. However following draw-backs could be observed:

- Supply is not continuous but alternates on daily basis
- The discharge of the springs decreases significantly during pre-monsoon season and the supply cannot be maintained

- Source is far from the end users (16 km)
- No alternate sources are provided for the end user in the case that the centralized system fails or undergoes maintenance
- The water production cost was figured out to be extremely high

### **Design of retention and storage facilities called Ooranies**

The use of retention and storage facilities has been identified by the expert committee as viable option for enhancing rural water supply as supplement for existing centralized supply schemes. This source provides a huge potential for future implementation in a wider scale. Sharp carved valleys and nullahs as well as less impermeable soils are the ideal conditions to provide small decentralized storage facilities, which additionally function as erosion protection as well as ground water recharge structures.

Two villages were identified on Bartang island, where the centralized water supply was causing problems and villagers used to collect water from a simple dug-hole, which is not fit for drinking water supply. In one of the two villages a storage tank has been identified, which provides an ideal facility to be developed as an Oorani drinking water supply pond.

**Figure 1: Flow design of an Oorani showing various treatment features**

The following pages will provide the basic design features for an Oorani at Bartang village, based on the mission findings. A detailed cost estimates is attached, however the cost estimations bases eon 2008 rates and may differ on Andaman&Nicobar islands. The local engineers are requested to verify the rates if required.

## Fact-Sheet for Bartang village Oorani

### General information

Name of the Oorani : -  
Panchayat : Bartang  
Block : -  
District : South Andaman  
N<sup>o</sup> of people served : 100  
Volume [m<sup>3</sup>] : 5,802  
Top surface [m<sup>2</sup>] : 1,735  
Bottom surface [m<sup>2</sup>] : 707  
Effective Depth<sup>1</sup> [m] : 5.0  
Catchment attached :  yes  no  
Catchment size [km<sup>2</sup>] : -

### Technical Features

<input checked="" type="checkbox"/> Grit Chamber	<input type="checkbox"/> Upflow Fine Sand Filter
<input checked="" type="checkbox"/> Site revetment	<input checked="" type="checkbox"/> Gravimetric Fine Sand Filter
<input checked="" type="checkbox"/> Clay Liner	<input checked="" type="checkbox"/> Fencing
<input checked="" type="checkbox"/> Shoot + Settling Basin	<input checked="" type="checkbox"/> Water meter
<input type="checkbox"/> Vertical Roughing Filter	<input checked="" type="checkbox"/> Monitoring station
<input checked="" type="checkbox"/> Horizontal Roughing Filter	N <sup>o</sup> of handpumps <u>2</u>

### Photos

Foto 1&2: Existing water retention structure at Bartang island, which can be developed as Oorani. Right side shows the current unhygienic condition of water collected from a dug-hole

### Input - box I

Evaporation  $\Rightarrow$  1560 mm per year  
130.0 mm per month (average)

**Parameter for evaporation**

Month	January	February	March	April	May	June	July	August	September	October	November	December
Evaporation in mm per month	86.0	103.0	143.0	159.0	177.0	174.0	162.0	140.0	139.0	111.0	79.0	87.0

**Inhabitants of the village / Demand of drinking water**

Number of inhabitants: 100 person  $\Rightarrow$  2.50 m<sup>3</sup> per day  
 Demand of drinking Water per day: 25 lpcd  $\Rightarrow$  Total demand of water

**Attention!**  
Program is running in advanced mode,  
not all warnings will be displayed!

Run Calculation      Advanced Options

### Input - box II

For rectangular design, please enter proportion between length and breadth in the yellow cell.

$a_0$   $b_0$

$a_0 / b_0 =$  1 / 1.00

### Correction for the calculation

circular design / base diameter: 30 m Calculate

rectangular design / base length: 30 m Calculate

**NOTE**  
Enter the proportion between  $a_0$  and  $b_0$  for rectangular design in Input - box II.

**NOTE**  
The heights of evaporation are taken from Input - box I.

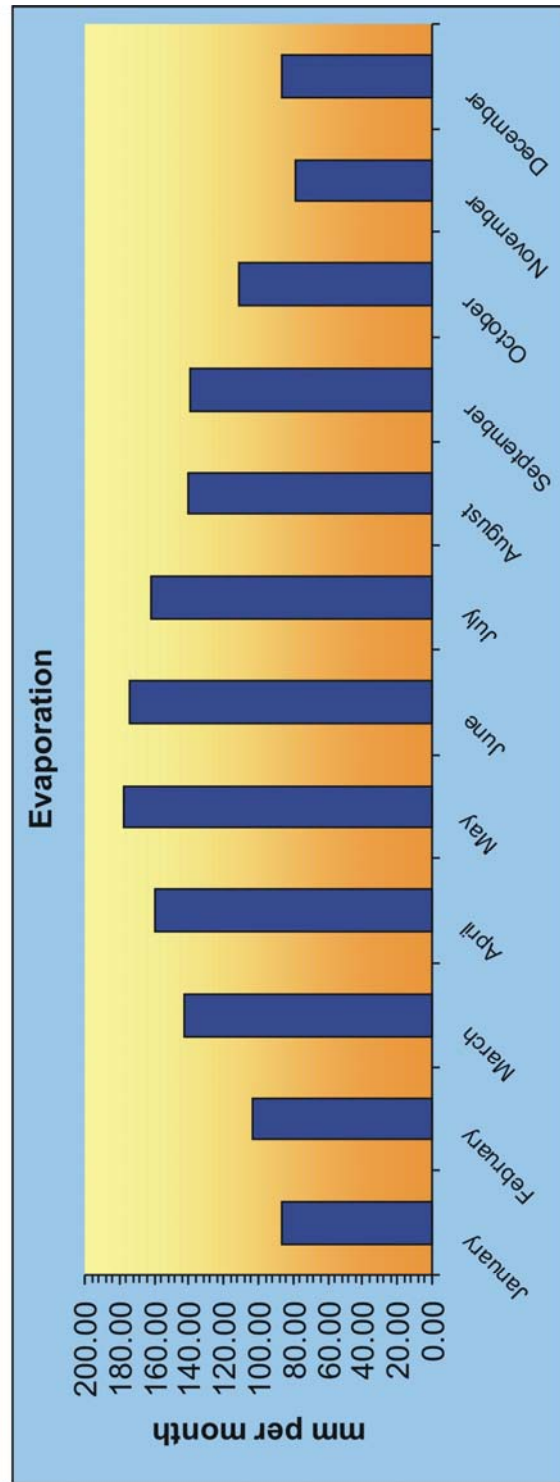

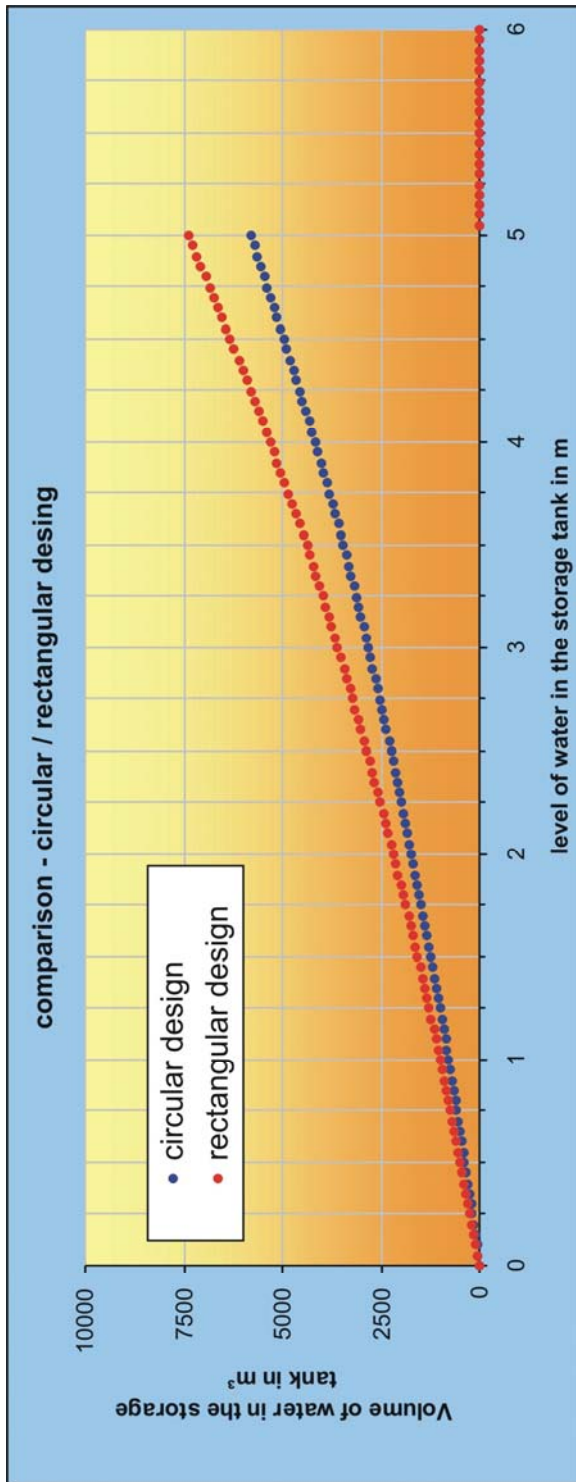

**NOTE**  
The depth of the storage tank is set as 5 m, if not changed in advanced mode.

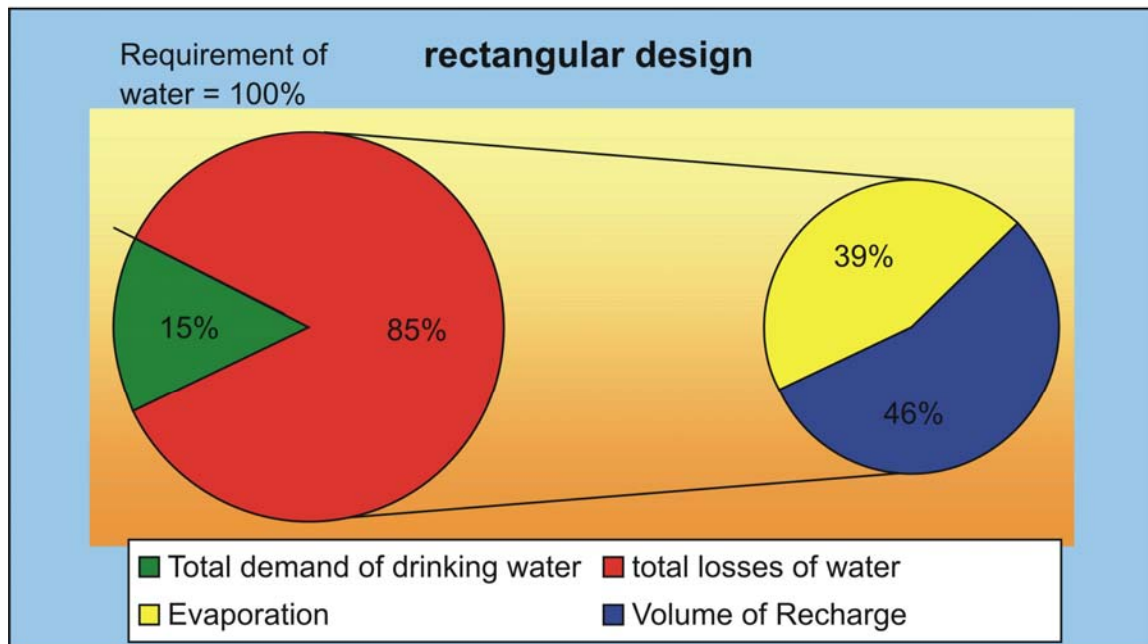

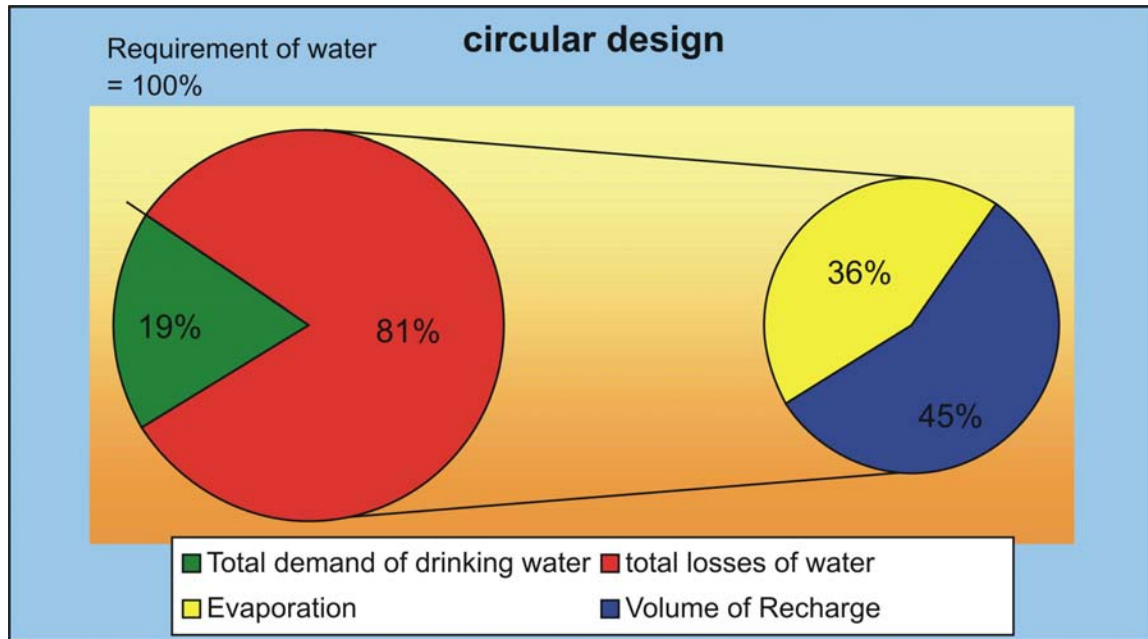

Table 1: Results from the calculation.

Parameter	unit	circular	rectangular	Diff (Value)	Diff (%)	circular (100%)	rectangular in %
$a_0 / d_0$	m	30	30	0	0	100	100
$a_2 / d_2$	m	47	47	0	0	100	100
Volume of the storage tank	m <sup>3</sup>	5802	7388	-1585	-27	100	127
Area of Surface	m <sup>2</sup>	1735	2209	-474	-27	100	127
Area of Bottom	m <sup>2</sup>	707	900	-193	-27	100	127
Circumference of the storage tank	m	148	188	-40	-27	100	127
Area of Revetments and Berm	m <sup>2</sup>	1209	1540	-330	-27	100	127
Volume of Evaporation	m <sup>3</sup> per year	1788	2368	-580	-32	100	132
Volume of Recharge	m <sup>3</sup> per year	2229	2838	-609	-27	100	127
Total water losses	m <sup>3</sup> per year	4017	5206	-1189	-30	100	130

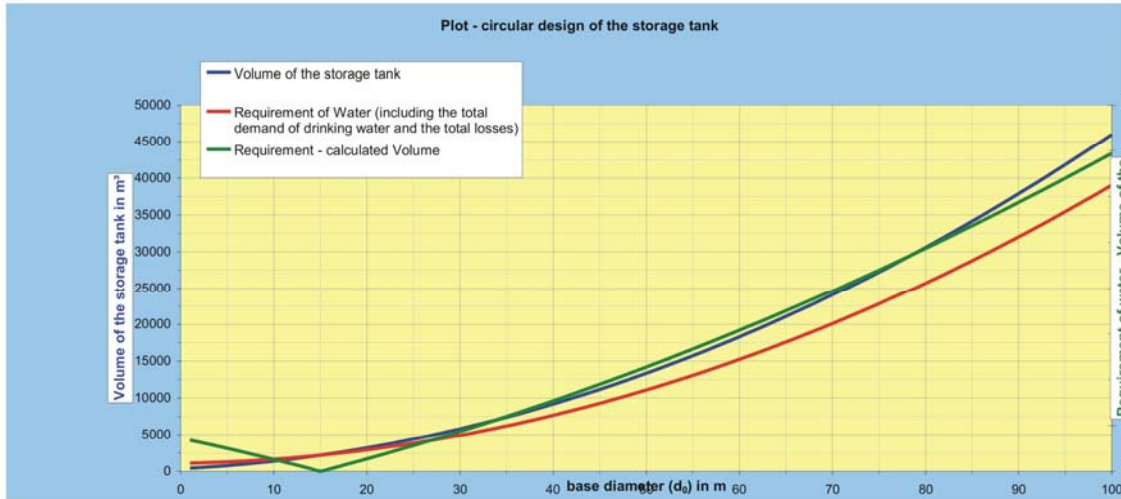

Total demand of drinking water: 2.50 m<sup>3</sup> per day

**Design for a circular storage tank**

length / m	value
$d_0$	30.0
$d_1$	40.5
$d_2$	47.0
$h$	5.0
$h_1$	3.5
$h_2$	1.5
$e_1$	5.3
$e_2$	2.3
$B$	1.0

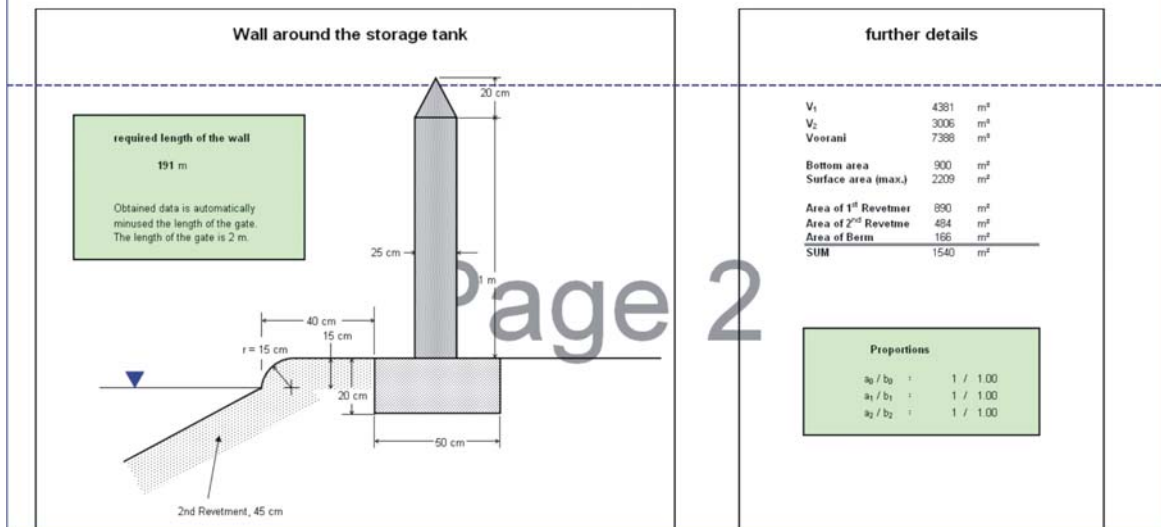

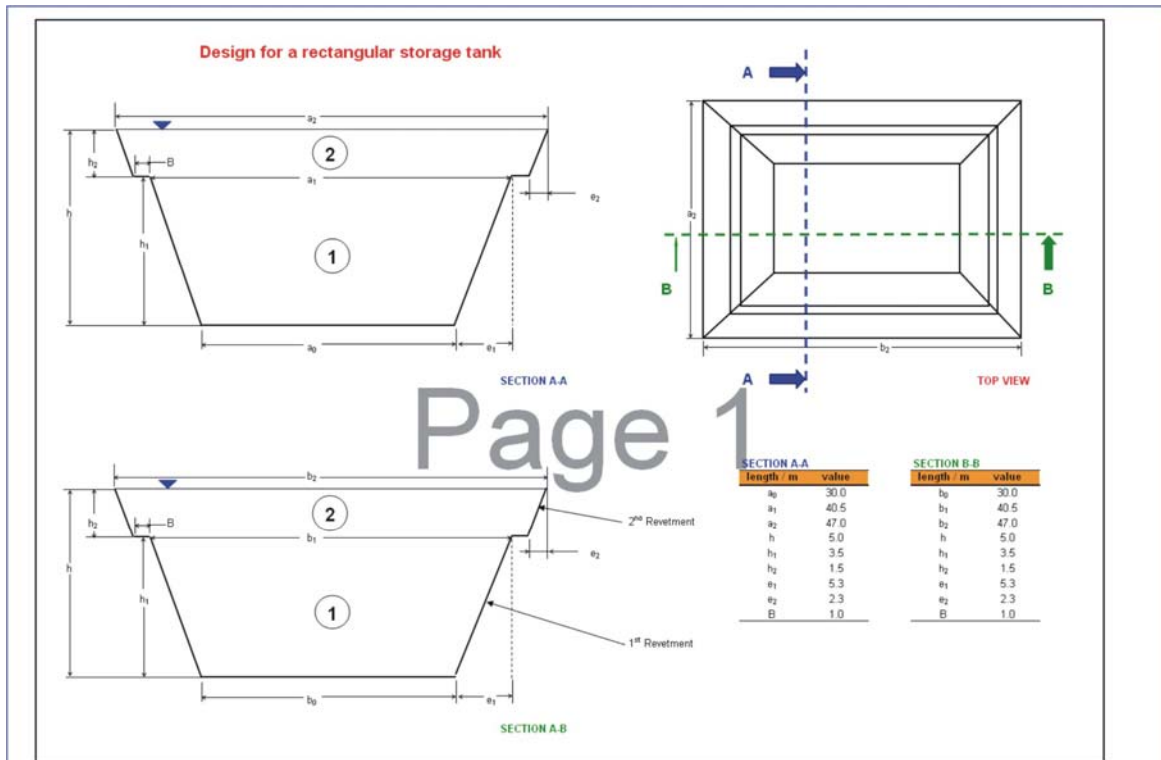

**Wall around the storage tank**

required length of the wall  
150 m  
Obtained data is automatically  
minused the length of the gate.  
The length of the gate is 2 m.

**further details**

$V_1$	3441
$V_2$	2361
$V_{Oorani}$	5802
Bottom area	707
Surface area (max.)	1735
Area of 1 <sup>st</sup> Revetment	699
Area of 2 <sup>nd</sup> Revetment	380
Area of Berm	130
<b>SUM</b>	<b>1209</b>
